

CaseWare AnalyticsAI

For every engagement.

CaseWare AnalyticsAI brings results directly into engagements. With artificial intelligence-based analysis, AnalyticsAI improves efficiency, quality, and value by analyzing all data at once. The tool swiftly analyzes transactions by automatically performing multiple routine tests on the whole transaction set to determine risk. AnalyticsAI promises to grant auditors and business service professionals unprecedented access to advanced data analytics throughout an engagement, something that has become critical to the data-driven audit.

The power of AnalyticsAI

Easy to use analytics

Makes it easier to perform analysis in any engagement by bringing automated testing into established workflows, automating the data acquisition process and lowering the learning curve for auditors new to analytics.

Perform better audits

Analyzes the entire data set to find exceptions and to identify areas of higher risks, allowing auditors to perform more thorough audits.

CASEWARE®

Key Features of AnalyticsAI

Data Mapping and Workflow Optimization

Streamline the initial engagement set-up with import tools and automated workflow optimization. The scope of work is tailored to ensure the engagement file is not over or under worked.

Data Validation and Completeness

Auditors can rely on the data uploaded through the data reliability checklist. Data completeness can be confirmed automatically through data reconciliation, control totals, and data profiles.

Powerful Insights

Auditors can compare transactions across multiple dimensions, including account type, time and date, as well as rank transactions by relative risk.

Risk-Based Transaction Analysis

Auditors can tailor their analysis on the characteristics of the entity being audited. If an account requires a closer look, it can be flagged to determine audit priority, scope, and risk score.

Ai-Based Testing

Leveraging Artificial Intelligence and Machine Learning, dozens of tests can be performed on an entire transaction set. The solution spots anomalies and groups items to show risk by journal source.

Integration and Reporting

Generate configuration reports that facilitate more meaningful audit analysis with documented, understandable evidence. Results are then carried through to the Working Papers engagement.
